### Ocean Conservancy

Ocean Conservancy promotes healthy and diverse ecosystems and opposes practices that threaten ocean life and human life. Through research, education, and science-based advocacy, Ocean Conservancy informs, inspires, and empowers people to speak and act on behalf of the ocean. In all its work, Ocean Conservancy strives to be the world's foremost advocate for the ocean.

### The International Coastal Cleanup

In partnership with volunteer organizations and individuals across the globe, Ocean Conservancy's International Coastal Cleanup engages people to remove trash and debris from the world's beaches and waterways, to identify the sources of debris, and to change the behaviors that cause marine debris in the first place.

**LOOKING TOWARD THE 25TH ANNIVERSARY INTERNATIONAL COASTAL CLEANUP ON SEPTEMBER 25, 2010,** Ocean Conservancy is releasing this annual marine debris report spotlighting how trash travels to and throughout the ocean, and the impacts of that debris on the health of people, wildlife, economies, and ocean ecosystems. When we allow trash to fall from our hands and move from land to sea and around the world on ocean currents, we create much more than an eyesore. Marine debris has become one of the worst pollution problems of our time. We've trashed our ocean—and it's time for us to turn the tide.

## INTRODUCTION

# Message in a Bottle

02

**G**rowing up, I loved beachcombing. I was enthralled with the romantic possibility that I might come across a note in a bottle, launched from across the globe and carried to me on ocean currents.

That notion isn't so romantic today. During the International Coastal Cleanup in September 2009, half-a-million volunteers in 108 countries and locations around the world picked up trash from the world's waterways. Divers went below the surface to collect debris, and boaters scooped up trash on hard-to-reach beaches. These volunteers also recorded what they found—including more than a million bottles, each carrying a new message: Trash in our ocean and waterways has created one of the worst pollution problems of our time.

Trash travels, and no beach, lakeshore, or riverfront is untouched—no matter how remote. All of us have contributed. An estimated 60–80 percent of marine litter starts

out on land. Much originates along the coast, but litter also finds its way to the ocean by way of storm drains and waterways. Once trash arrives in the ocean, it can travel thousands of miles carried by ocean currents and winds.

There's no doubt, trash in the ocean is ugly. From single-use shopping bags to huge lost fishing nets, marine debris impacts ecosystems, coastal economies, and wildlife. Items like syringes and disposable diapers along with sharp pieces of metal and glass pose health hazards. And trash that falls from our hands to the sea could be there for generations to come, affecting the health of the ocean—a life-support system that provides us food, water, and oxygen. The ocean also drives our climate, and fuels economies. When we trash our ocean, we are trashing our own health and well-being.

The exciting news is that elected officials, CEOs, community leaders, and private citizens are coming together to solve this

problem. President Obama has appointed an Interagency Ocean Policy Task Force, making ocean protection a top national priority. Local governments are working hand-in-hand with residents and nongovernmental organizations to develop comprehensive marine debris prevention plans across entire regions. Corporations are using their ingenuity to create technological solutions through “greener” product design and packaging. And Ocean Conservancy's International Coastal Cleanup represents a growing network of hundreds of thousands of people each year who join in the world's largest volunteer effort to clean up the ocean and waterways.

The data these volunteers collect are used to update the Marine Debris Index. In the pages of this report, you will learn about the impacts of traveling trash, and where this traveler originates. Cleanups alone can't solve the problem; we must also stop marine debris at the source.

Please join us for our landmark 25th Anniversary Cleanup in September 2010. To sign up for a Cleanup—or lead one of your own—visit [www.oceanconservancy.org/cleanup](http://www.oceanconservancy.org/cleanup). Together, we can start a sea change.

For the ocean,

**VIKKI SPRUILL**  
PRESIDENT AND CEO,  
OCEAN CONSERVANCY

A MESSAGE FROM

# Philippe Cousteau

**WE CAN  
COME  
TOGETHER—**  
youth and adults,  
governments  
and corporations,  
nonprofits and  
scientists—  
and **STOP  
MAN-MADE  
ITEMS FROM  
GETTING  
INTO OUR  
OCEAN.**

03

**W**ater, one of the most precious substances on the planet, sustains all life. I come from a family that has studied and revered the ocean for three generations; my grandfather Jacques Cousteau called our home “the water planet,” and devoted his life’s work to showing the world how important the ocean is to our very existence on Earth. It covers more than two-thirds of the globe, an area so large that we’ve thought of it like outer space—out of sight and seemingly infinite. But today we have the ability to explore the farthest corners of the sea, and we’ve documented big changes since my grandfather’s time.

We know that the trash we put in the ocean is affecting everything from water quality to local economies and human health. I saw it myself in beautiful Papua New Guinea, where cans, bottle caps, and countless other items from our disposable society had arrived ahead of me on those remote shores.

When trash travels, it carries impacts along with it that affect us all. We live in a global community, connected by cutting-edge social networking technologies—yet we are bound together as well by our common connection to the ocean. And that’s what I tell the young people I work with.

We can find solutions to great environmental problems like this one, and I believe there are millions of young people in the world who have the will to implement those solutions. My sister and I founded the nonprofit organization EarthEcho International to empower youth to take action that restores and protects our water planet. EarthEcho’s new Water Planet Challenge will provide the tools and resources they need to plan their own service-learning projects. Experts will provide a solid foundation of knowledge, and through hands-on experiences, like Ocean Conservancy’s International Coastal Cleanup, these young people will gain conservation knowledge and skills they can use throughout their lives.

The Challenge is reaching out to them at a time when they are forming lifelong behaviors. There are behavior changes we can all make to craft a world we can thrive in and protect for generations to come. We can come together—youth and adults, governments and corporations, nonprofits and scientists—and stop man-made items from getting into our ocean. From the habits of concert-goers or picnickers to the daily workings of large corporations, we can make changes to stop the dangerous flow of marine debris. Please read this report to learn more, and especially encourage the young people you know to join this global movement. The future of our ocean depends on them.

**PHILIPPE COUSTEAU**  
CEO, EARTHECHO INTERNATIONAL  
BOARD MEMBER, OCEAN CONSERVANCY

# Executive Summary

04

Marine litter is symptomatic of a wider malaise: namely the wasteful use and persistent poor management of natural resources. The plastic bags, bottles, and other debris piling up in the oceans and seas could be dramatically reduced by improved waste reduction, waste management, and recycling initiatives.

**Achim Steiner** UNITED NATIONS UNDER-SECRETARY-GENERAL  
AND UNITED NATIONS ENVIRONMENT PROGRAMME EXECUTIVE DIRECTOR

Each year, Ocean Conservancy provides a compelling global snapshot of marine debris collected and recorded at more than 6,000 sites all over the world on a single day during the International Coastal Cleanup. The world's largest volunteer effort for the ocean and waterways began nearly twenty-five years ago with the efforts of one woman, and today works towards global solutions through the cumulative efforts of half-a-million volunteers around the world. This year's annual report, *Trash Travels: From Our Hands to the Sea, Around the Globe, and Through Time*, highlights the 2009 data and also explains how trash improperly discarded can travel long distances in the water, becoming one of our greatest global pollution problems.

During the 2009 International Coastal Cleanup, 498,818 volunteers picked up 7.4 million pounds of marine debris, in 108 countries and locations around the world and 45 US states and the District of Columbia. Marine debris is defined as "any persistent, manufactured or processed solid material discarded, disposed of, or abandoned in the marine and coastal environment."<sup>31</sup> Items ranging from cigarette butts to 55-gallon drums and household appliances inflict major impacts on the health of the ocean as a whole as well as that of humans, wildlife, and coastal economies.

No matter where we live, the ocean is our life support system, providing much of the food, water, and oxygen we need to survive. When we compromise the ocean's health, we compromise our own. Marine debris

also directly impacts human health. Sharp items like broken glass or metal cans cut beachgoers, while disposable diapers, condoms, and old chemical drums introduce bacteria, toxic compounds, and other contaminants into the water. Marine wildlife suffers from dangerous encounters with marine debris as well, facing sickness and death from entanglement or ingestion of man-made objects. And the pervasive problem of marine litter even impacts economic health.

The comprehensive, long-term body of data compiled by Ocean Conservancy and an army of volunteers each year—the Marine Debris Index—is the only country-by-country, state-by-state, item-by-item accounting of trash on beaches and along coastal and inland waterways. These data have been

INDIA

collected systematically since 1989. Of the 43 items tracked during the Cleanup, the top three items (by number) found worldwide in 2009 were cigarettes/cigarette filters, plastic bags, and food wrappers/containers.

The knowledge that certain items show up more in certain places can help shape local prevention efforts. During the 2009 Cleanup, volunteers found 18,000 derelict fishing nets in the United Kingdom alone, and 70,000 plastic bottles in Nicaragua. In 2009, 60 percent of all debris items found on just one day were “disposable.”

The Marine Debris Index has informed major marine debris laws like the US Marine Debris Research, Prevention, and Reduction Act, and has also helped inspire changes in the behaviors that cause marine

debris. The data have been cited in a number of major reports and plans concerning this global pollution problem, from California’s state marine debris action plan<sup>6</sup> to the United Nations Environmental Programme’s 2009 worldwide survey *Marine Litter: A Global Challenge*.<sup>31</sup>

Because trash travels, we are all part of the problem—and the solution—whether we live hundreds of miles inland or along the ocean’s shores. This year’s Cleanup report examines the phenomenon of trash on the move to and throughout the ocean, and the resulting impacts worldwide. Cleanup data tell us that an estimated 60–80 percent of marine litter starts out on land. Lakes, rivers, streams, and storm drains, helped by the wind, transport litter hundreds of miles to the ocean. And ocean currents and winds

carry that marine debris all around the globe. Trash travels through time as well; estimates vary, but some items may last hundreds or even thousands of years in the water.<sup>4</sup>

The data from the International Coastal Cleanup help provide a roadmap for eliminating marine debris by showing what is out there so we can work together to reduce it at the source, change the behaviors that cause it, and support better policies to prevent marine debris from causing further harm to our vital ocean ecosystems.

# CLEANUP RESULTS

## THE MARINE DEBRIS INDEX

06

The International Coastal Cleanup is **THE WORLD'S LARGEST VOLUNTEER EFFORT ON BEHALF OF OCEAN HEALTH**. During the 2009 Cleanup, 498,818 volunteers were united in spirit on a single day across many time zones. In 108 countries and locations around the world, as well as in 45 US states and the District of Columbia, **THESE DEDICATED OCEAN CHAMPIONS PICKED UP 7,446,130 POUNDS OF DEBRIS AND RECORDED 10,239,538 INDIVIDUAL PIECES OF TRASH**, including cigarette butts, food wrappers, cans, and bottles.

### The Cleanup: History and Logistics

The International Coastal Cleanup got its start with one woman's effort to clean up marine debris on a local beach. Linda Maraniss, a former employee of Ocean Conservancy (then known as the Center for Environmental Education), was appalled by the amount of trash she saw while walking along the shores of South Padre Island, Texas. She felt compelled to clean up what she found, and she also wanted to know which trash items were the most prevalent.

The hands-on International Coastal Cleanup brings together like-minded people across the world to address one of the greatest pollution problems of our time, involving local residents along with employees of local businesses and governments, all of whom have a stake in finding solutions. Marine debris, which consists of "any persistent, manufactured or processed solid material discarded, disposed of, or abandoned in the marine and coastal environment,"<sup>31</sup> starts as a local issue, but requires global solutions because it often travels far beyond its origins, crossing political and geographical boundaries.

From that first Cleanup in 1986, the event has been a collaborative effort. Linda and her colleague Kathryn O'Hara worked together on a data card so people could catalogue the trash as they picked it up. Joining forces with the Texas General Land Office, they rallied volunteers. The results: In a mere two hours, 2,800 Texans picked up 124 tons of trash from 122 miles of coastline. As Maraniss says, "Trash travels; it's an international problem. If you're going to succeed with beach cleanups, you need the cooperation of citizens, government, and industry." In the course of nearly a quarter of a century, interest has surged and the Cleanup has become a major international movement to clean shorelines and waterways, collect data, and raise awareness about marine debris.

The Cleanup generally takes place on the third Saturday in September (though events may be scheduled throughout September and October to accommodate holidays, religious observances, or extreme weather). Throughout the year, a network of volunteer Cleanup coordinators identifies sites to be cleaned within their country, state, or territory, and recruits sponsors as well as volunteers for the day of the event. More people sign on each year (a million helping hands picked up debris in 2009), drawn not only by the serious and compelling impacts of this major pollution problem, but also by the fact that almost anyone, at any age or any stage of life, can easily participate and make a difference.

BANGLADESH

**ABOVE:** VOLUNTEERS RECORD EVERY ITEM THEY FIND ON STANDARDIZED DATA CARDS.

Volunteers including friends, neighbors, students, and co-workers fan out across shorelines picking up marine litter. Because lakes, rivers, and streams, along with the wind, can carry litter to the sea, Cleanups occur not just at the ocean, but inland as well, and take place in landlocked states and countries like Nevada and Luxembourg.

### The Data: A Tool for Better Decision-making

Volunteers don't just clean up; they tally every item they find on Ocean Conservancy's standardized data cards. This accounting of items picked up in just a few hours on one day provides a global snapshot of the marine debris problem. The item-by-item, location-by-location data have a long history of raising awareness about this global problem and informing policies and programs to address it.

To give a few examples, in 1987 Ocean Conservancy (then called the Center for Environmental Education) produced the report *Plastics in the Ocean: More Than a Litter Problem*, which was one of the first studies to identify plastics as a significant marine debris hazard. Information cited in the report helped spur the US Congress to enforce restrictions against dumping of garbage at sea by adopting Annex V of the International Convention for the Prevention of Pollution from Ships, also known as MARPOL 73/78 Annex V.

Corresponding national legislation, called the Marine Plastic Pollution Research and Control Act of 1987, restricted the dumping of garbage from boats, including a complete ban on dumping of plastics at sea, and helped control land-based sources of marine debris, such as storm water systems and combined sewer systems. In 2004, the US Commission on Ocean Policy report<sup>32</sup> cited the International Coastal Cleanup data as significant in characterizing the types, amounts, and sources of marine debris collected along the beaches and waterways in the US and its territories. The data from the International Coastal Cleanup also helped inform the passage of the 2006 Marine Debris Research, Reduction, and Prevention Act. In Washington, DC, where Cleanup data documented that single-use bags comprise a large component of local

## 2009 WORLDWIDE SOURCES OF MARINE DEBRIS

**MARINE DEBRIS** starts as a local issue, but requires global solutions because it **OFTEN TRAVELS FAR BEYOND ITS ORIGINS**, crossing political and geographical boundaries.

marine debris, the Anacostia River Cleanup and Protection Act of 2009 implemented a five-cent fee on disposable paper or plastic bags provided by retailers; anecdotal information reported in the press suggests that consumption of the bags dropped fifty percent almost immediately. And California used the data when developing a comprehensive state plan to address all aspects of marine debris.<sup>6</sup>

### Data collection

Volunteers record what they find on standardized data cards that list the most common marine debris items, and allow volunteers to record unusual finds as well. In 2009, "weird finds" included go-karts, a gumball machine, plastic vampire teeth, and a swimsuit-wearing mannequin. From bottle caps to major appliances, debris items are catalogued in categories according to sources (see page 40 for definitions). Coordinators ensure that the data reach Ocean Conservancy, which compiles and analyzes the information. A new online data entry system streamlines the process and minimizes transcription errors.

# 60 PERCENT of all debris items found in 2009 were “DISPOSABLE.”

10

DURING THE 2009 CLEANUP, VOLUNTEERS FOUND

**58,881**  
BOTTLES OF OIL/LUBE

REPRESENTING OIL CHANGES FOR NEARLY

**12,000**  
CARS

The resulting Marine Debris Index helps identify the sources of marine debris so that solutions can be put in place. For example, the data show that 60 percent of all debris items found in 2009 were “disposable,” including 512,517 cups, plates, forks, knives, and spoons—enough for a picnic for over 100,000 people. Focusing prevention efforts on reducing and properly disposing of these items has great potential for reducing debris in our ocean and waterways.

For the complete Marine Debris Index and methodology, including state-by-state and country-by-country breakdowns, please see pages 41 through 53; to view additional information, visit [www.oceanconservancy.org](http://www.oceanconservancy.org).

In 2009, hard-to-reach locations were covered by 1,986 boaters who collected 52,133 pounds of debris. And because marine debris doesn't stop at the waterline, 14,116 scuba divers (organized by the Project AWARE Foundation) plunged into the water to retrieve 320,437 pounds more. The Cleanup took place at 6,430 sites around the world.

## Sources of Marine Debris

Identifying where marine debris originates is key to developing solutions. Ocean Conservancy identifies five categories of marine debris sources to better understand where the trash reaching our ocean starts out.

- » **SHORELINE & RECREATIONAL ACTIVITIES.** The majority of marine debris comes from land-based activities like eating fast food and discarding the wrappers, beach trips and picnics, sports and recreation, and festivals. Litter travels into the ocean from streets, parking lots, and storm drains.
- » **OCEAN/WATERWAY ACTIVITIES.** People engaged in recreational fishing and boating, commercial fishing, cargo/military/cruise ship operations, and offshore industries such as oil drilling contribute to marine debris.
- » **SMOKING-RELATED ACTIVITIES.** Careless disposal of cigarette filters, cigar tips, lighters, and tobacco product packaging is common on both land and sea.
- » **DUMPING ACTIVITIES.** Legal and illegal dumping of domestic and industrial garbage, construction materials, and large household appliances puts large quantities of harmful items into the sea.
- » **MEDICAL/PERSONAL HYGIENE.** Items ranging from tampons and disposable diapers to syringes enter the water most often through sewer systems.

**BRAZIL**

## SOURCES OF MARINE DEBRIS BY REGION

SOURCE	AFRICA	NORTH AMERICA	CENTRAL AMERICA	SOUTH AMERICA	CARIBBEAN	SOUTH-EAST ASIA	WESTERN ASIA	EUROPE	OCEANIA
SHORELINE & RECREATIONAL ACTIVITIES	76.1%	55.2%	84.9%	69.7%	82.6%	72.4%	60.5%	60.4%	75.2%
OCEAN/WATERWAY ACTIVITIES	12.7%	5.0%	4.8%	12.0%	6.6%	12.7%	9.7%	24.9%	5.2%
SMOKING-RELATED ACTIVITIES	8.4%	37.2%	8.0%	15.4%	7.7%	11.2%	27.7%	11.1%	19.7%
DUMPING ACTIVITIES	1.8%	1.9%	1.1%	2.0%	1.8%	1.6%	1.5%	2.8%	1.8%
MEDICAL/PERSONAL HYGIENE	1.0%	0.7%	1.2%	1.0%	1.3%	2.0%	0.6%	0.8%	1.1%

SOURCE: OCEAN CONSERVANCY/INTERNATIONAL COASTAL CLEANUP 2009

In addition, regional trends tracked by source can help local planners identify and manage specific marine debris items. As the chart above shows, in 2009 Central America had the largest percentage of debris from Shoreline and Recreational Activities (84.9 percent). Europe had the largest percentage of items from Ocean/Waterway Activities, nearly a quarter of all their debris items. The United Kingdom removed nearly 18,000 fishing nets during the Cleanup, while North America had the highest percentage of debris from Smoking-related Activities, with 37 percent of debris items coming from this category. Percentages of debris from both Dumping Activities and Medical/Personal Hygiene were fairly consistent throughout the world. One item collected in large numbers in a particular region can point decision-makers towards specific solutions, as in Nicaragua where volunteers found over 70,000 plastic bottles during the 2009 Cleanup—an average of 11 plastic bottles per volunteer. To put the Nicaragua statistic in perspective, only the United States picked up more bottles as a country, and the much larger US has 28 times more volunteers cleaning its shores.

On the list of top ten items found worldwide, cigarettes and cigarette filters were the most prevalent debris items found during the Cleanup, accounting for nearly twice the number of any other debris item; volunteers removed more than 2.2 million from beaches and inland waterways. Plastic bags placed second (1.1 million), accounting for one out of every ten items removed and tallied, followed by food wrappers/containers (943,233). In addition, 73 percent of the top ten debris items came from Shoreline and Recreational Activities, and 27 percent from Smoking-related Activities. Nine out of the top ten debris items are disposable.

AVERAGE AMOUNT OF TRASH  
PICKED UP PER PERSON:

**15**  
POUNDS

### The Inland Connection

Blown by the wind or carried on lakes, rivers, and streams, trash from far inland can travel to the ocean, so Cleanups take place both inland and along the ocean's coasts. During the 2009 Cleanup, 75 percent of all debris items were collected from coastal areas, and 25 percent were collected from inland waterways. Nearly 380,000 volunteers worked along the ocean's coasts, while more than 120,000 people participated inland. The average amount of trash picked up per person was 15 pounds. Nearly every item found in the top ten coastal Cleanups was also found in the top ten inland Cleanups, showing that the most prevalent items are common to each. Cigarettes and cigarette filters were the number one item found during both, with 1.5 million removed during coastal Cleanups and over 620,000 picked up inland.

### Volunteer Participation

Slightly more than half the participants in 2009 came from outside the United States, where the Philippines, Canada, and India had the greatest turnouts. The Philippines nearly doubled their numbers from 2008. Five countries joined the effort for the first time: Cambodia, Cape Verde, Namibia, Samoa, and Togo. The countries with the most Cleanup sites were the United States (2,669), Canada (1,337), and the United Kingdom (418).

In the United States, 218,779 volunteers collected 4,253,650 pounds of trash along an estimated 9,151 miles of shoreline. They covered 45 states and the District of Columbia. The states with the most individual Cleanup sites were California (612), Florida (360), and New York (269). California reached an all-time high of 82,365 volunteers, 38 percent of the US total. Georgia was second with 23,668 volunteers (nearly 11 percent of the US total), followed closely by Florida with 22,703 volunteers (10 percent). The top ten states accounted for nearly 84 percent of US volunteers.

### Threats to Human Health

Nearly 200,000 items tallied during the Cleanup pose a direct public health threat. Debris from Dumping Activities (appliances, batteries, cars/car parts, and 55-gallon chemical drums) can release toxic compounds into the water, while items from the Medical/Personal Hygiene category (condoms, disposable diapers, syringes, and tampons/tampon applicators) may convey bacteria and other contaminants. Volunteers found 15,076 syringes worldwide during the 2009 Cleanup.

### Dangers to Wildlife

As they pick up litter, volunteers also note wildlife they find entangled in debris. In 2009, they found 336 marine birds and animals entangled in debris. 120 were alive and released, and 216 entangled birds and animals were found dead, including a seal in California discovered entangled in fishing line. Birds were the number-one victim, accounting for 41 percent of dead marine life found. Fishing line and lost or derelict fishing nets were the two most prevalent types of entangling debris (62 percent).

Wildlife doesn't just become entangled in debris; birds, animals, and fish often ingest items they encounter in their ocean homes. They eat bottle caps, cigarette butts and lighters, fishing line, and a host of other objects. Ocean Conservancy surveyed the literature to identify the items known to choke or entangle wildlife.

# TRASH TRAVELS

## THE TRUTH—AND THE CONSEQUENCES

16

The hardest truth about the state of our marine environment is that **WE'VE TRASHED OUR OCEAN**, the source of much of the food, water, and oxygen we need to survive. No matter where we live, the ocean is our life-support system, providing all these essentials for us on a daily basis. **MARINE DEBRIS IS NOW CONSIDERED ONE OF THE MOST PERVASIVE POLLUTION PROBLEMS PLAGUING OUR OCEAN AND WATERWAYS**, and our growing population is generating more of it than ever before.<sup>4,8,9</sup>

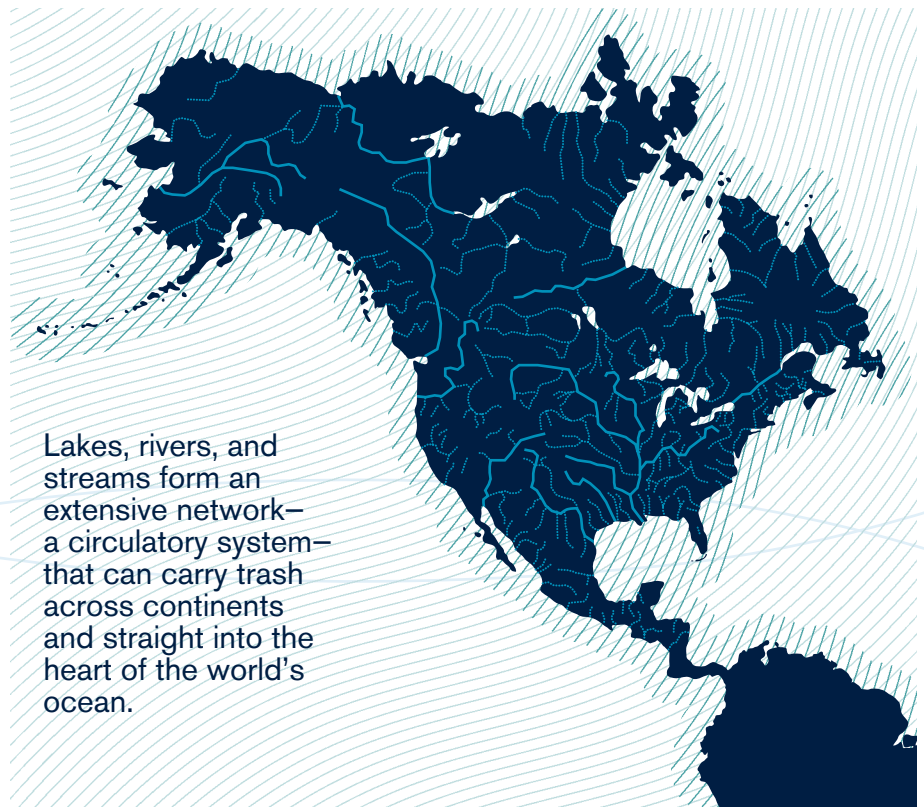

# An estimated 60–80 PERCENT of marine debris STARTS OUT ON LAND.

**B**ecause trash travels, we are all part of the problem—and the solution—whether we live hundreds of miles inland or along the ocean's shores. Trash travels from our hands to a storm drain to a stream to the sea. Many items move around the world on ocean currents, to even the most remote areas in the Antarctic. And trash travels through time; estimates vary, but some items may remain for hundreds or even thousands of years.<sup>4</sup>

Trash accumulating in our majestic ocean and along our beautiful beaches, riverbanks, and lakeshores is not only ugly, it's dangerous, degrading the ocean environment and harming countless marine animals and birds. It poses risks to our personal health: Paint cans and chemical drums leach toxic materials, diapers and medical waste spread bacteria and germs, and sharp items cut beachgoers. And trash takes a toll on economic health. The Asia-Pacific Economic Cooperation (APEC) found that, in the Asia-Pacific region alone, marine debris was estimated to cost more than US\$ 1 billion a year, from clean-up to boat repairs.<sup>16</sup> Fishing, transportation, and tourism industries around the world feel the impact along with governments and local communities.

Rising population pressures (particularly near coastal areas), inadequate infrastructure and waste management facilities, littering and improper waste disposal, a lack of effective regulatory policies and enforcement, and a wasteful society all contribute to the problem.

Lakes, rivers, and streams form an extensive network—a circulatory system—that can carry trash across continents and straight into the heart of the world's ocean.

## Trash Travels from Our Hands to Land to Sea

An estimated 60–80 percent of marine debris starts out on land.<sup>14</sup> Clearly, preventing land-based debris can reduce the problem of trash entering our waterways dramatically. Lakes, rivers, and streams form an extensive network—a circulatory system—that can carry trash across continents and straight into the heart of the world's ocean. A beverage can carelessly cast away in a park hundreds of miles inland might blow into a nearby waterway and make it to the ocean.

### The role of watersheds

A watershed is a region in which all precipitation and all waterways eventually flow together. Picture this: Thirteen major rippling streams and creeks feed into Washington, DC's Anacostia River, each collecting and carrying litter like food wrappers blown or

thrown from land. The Anacostia then merges into the bigger Potomac River, which surges on to Chesapeake Bay and from there to the Atlantic Ocean, ferrying debris all the way. The Anacostia and its tributaries are but a part of the Potomac watershed, which collects trash from an area of over nine million acres encompassing portions of four states and the District of Columbia. Five million people make their home there.<sup>22</sup> And so it goes; there are countless watersheds all over the world, each bearing trash toward the ocean. For this reason, the US Environmental Protection Agency, a leader in marine debris prevention in the US and a long-time Cleanup partner, follows a watershed approach in battling trash that targets the types, sources, and conveyances of marine debris throughout watersheds, not just where it accumulates along shorelines.

## SIX DEGREES OF SEPARATION

A bag from a store in Tennessee (1) blows from a picnic site (2) into a storm drain (3) to the Mississippi River (4) and travels downriver (5) to the Gulf of Mexico, where it endangers a sea turtle that tries to eat it (6).

### Storm drains don't just carry rain water

Storm drains are a key portal in the transport of trash. Heavy rains surging along roads, sidewalks, and parking lots sweep up cigarette butts, food wrappers, plastic bottles, and other items carelessly cast aside and carry them into storm sewers. These sewers do not usually flow into municipal water treatment systems, but instead empty directly into nearby waterways. Small, lightweight items are easily borne by the water. For example, volunteers with the International Coastal Cleanup find more cigarette butts than any other single item—millions of them. Unsightly to look at, slow to degrade, and difficult to clean up, cigarette butts in the water aren't just unsightly; they can clog the digestive tracts of birds, fish, and other animals that eat them.

Another concern is combined sewer systems that connect sewer and storm-water runoff pipes; during heavy rains, these systems can be overwhelmed, causing everything from litter to medical waste, condoms, and tampon applicators to flow directly into local waterways.<sup>33</sup> In countries without storm drains, debris washes directly into stream beds, eventually making its way to the ocean.

### Trash Circling the Globe Driven by Wind and Ocean Currents

Marine debris starts out as a local problem, but easily goes global as it circulates thousands of miles in the ocean. How far can it

travel? In 1990, a cargo ship bound for Los Angeles from Korea encountered a storm, and 78,932 Nike™ sneakers were lost at sea. Eight months later, they were washing

up 2,000 miles away on Vancouver Island in Canada. Others drifted south to the Oregon coast. In 1992, another cargo ship, this one en route from Korea to Tacoma, Washington, lost 28,800 colorful plastic bathtub toys. A rainbow flotilla of “rubber duckies,” turtles, beavers, and frogs began roaming the seas. Sixteen years later many were still drifting, some as much as 34,000 miles—far enough to circle the planet almost one-and-a-half times.<sup>10</sup>

**LEFT:** INLAND CLEANUPS LIKE THIS ONE ON A MARYLAND CREEK ARE CRITICAL BECAUSE TRASH CAN TRAVEL ON TO RIVERS AND THE SEA.

Unfortunately, the very traits that make today’s modern synthetic materials so useful turn them into ideal ocean travelers. Lightweight and buoyant, yet sturdy items like drinking straws, balloons, and disposable cups easily travel long distances.

### Alien hitchhikers

Marine debris has also become an all-too-common mode of transport for disruptive invasive species. Living organisms may hitch rides on marine debris and end up in new ecosystems where they can disrupt ecosystem

relationships. Centuries ago, black rats stowed away on ships from Europe and traveled to Hawaii where none lived before. In this environment, without natural predators, the newly arrived species reproduced rapidly and preyed upon native bird populations, exacting a heavy toll.

The same thing occurs today, only the species have changed. The risk of alien invasions is increasing because of the sheer volume of buoyant, man-made debris that can

transport species across vast stretches of ocean—much of this debris ending up in coastal areas where hitchhiker-carrying ships can’t reach. One researcher has estimated that marine debris has increased the opportunities for organisms to hitch a ride by two to three times.<sup>3</sup> Once in their new home, they can compete with local species, often without natural predators to keep their populations in check. If they thrive and reproduce, these invasive species can upset key functions of local ecosystems.

## GLOBAL SURFACE CURRENTS

Ocean currents enable trash discarded in one country to land on the shores of another thousands of miles away.

**ABOVE:** ROPES, OLD FISHING GEAR, AND SIMILAR DEBRIS CAN POSE AN ENTANGLEMENT DANGER TO WILDLIFE AND ALSO DAMAGE BOAT PROPELLERS.

## Trash Traveling Through Time

Like so much of what we put into the ocean, those spilled bathtub toys didn't just travel physically, they traveled through time as well. Think of the useful life of a single-use shopping bag, designed to be the length of your errand, maybe a half-hour, tops. But like so many inexpensive conveniences of our modern world, that bag can find its way to the ocean, taking years to degrade. Once in the water, it might be eaten by an endangered sea turtle that could mistake it for a jellyfish and die. Or it could tangle in a propeller and burn out a boat motor, causing expensive repairs, delays, or safety problems.

Estimates for how long it takes particular items to degrade in the ocean vary widely and more research is needed, but much of the modern-day litter traveling the ocean and washing up on beaches will likely remain for many years into the future. Manufactured goods made from more durable synthetic materials last a lot longer than those once made from biodegradable,

natural materials. And long-lasting debris like lost fishing gear has long-lasting impacts. Nets, buoys, traps, and fishing line are now manufactured with stronger synthetic materials. In the Northwestern Hawaiian Islands, 52 metric tons of fishing gear and other debris—the weight of more than ten Dodge Ram pickup trucks—are estimated to accumulate annually.<sup>7</sup> This debris breaks delicate coral reefs, smothers sea life on the ocean floor, and entangles animals like the critically endangered Hawaiian monk seal.

**ABOVE:** DISCARDED FISHING LINE HAMPERS THE ABILITY OF THIS LOGGERHEAD SEA TURTLE HATCHLING TO SWIM AND FEED.

“Ghost fishing” occurs when these nets and traps, left untended by fishermen, continue to catch marine life that ultimately dies.

Plastic is a particularly pervasive time traveler. The National Research Council's 2008 report, *Tackling Marine Debris in the 21st Century*, states that “Marine debris, especially plastic debris, is now ubiquitous in the oceans and along coasts.”<sup>19</sup> Plastics have improved our lives in many ways, from innumerable technological advances to energy savings and packaging,<sup>2</sup> but it should come as no surprise that there is a wide range of evidence and diversity of scientific opinion about plastics. In fact, an entire issue of the prestigious *Philosophical Transactions of the Royal Society B* was recently devoted to the theme of “Plastics, the environment, and human health.”<sup>21</sup>

What is clear is that the physical characteristics that make plastics ideal for manufactured items like food containers and packaging—low cost, low weight, and durability—also allow them to travel a long time and great distances as debris. This problem is exacerbated in the ocean; most plastics degrade more slowly in water than on land due to reduced exposure to the sun's UV rays and cooler temperatures.<sup>1</sup>

Some other types of debris—glass, for example—also may persist for long periods of time, but one of the characteristics of plastic products is the tendency to break down into smaller and smaller pieces (less than 5 mm) called “microplastics” over time. Because of their tiny size and light weight, microplastics can circulate and remain physically and biologically available in ocean waters and sediments for a long time, and researchers have identified them as an emerging concern for global conservation of biodiversity.<sup>26</sup>

Microplastics can come from several sources: Debris items like food containers abrade and disintegrate. Pre-production plastic pellets called “nurdles,” which are used in the process of manufacturing finished plastic products, can spill and wash down storm drains and rivers to the ocean or get blown there on the wind. Yet another source is personal hygiene or household products, like exfoliating body scrubs and household cleaners, which contain abrasives made of tiny plastic beads. Virtually invisible to the

# THE MOUNTING COSTS OF TRASH IN OUR OCEAN AND WATERWAYS

**AS MORE TRASH TRAVELS TO OUR OCEAN AND WATERWAYS, IT IMPARTS A VARIETY OF SERIOUS IMPACTS—HERE ARE A FEW EXAMPLES:**

**TOURISM** When the water and beaches fill with trash, tourists and residents leave, and they take their money with them. Cleaning up beaches, disposing of the waste, and dealing with public health issues are a routine financial drain on communities that depend on tourism. In New York, debris washing up on shore was estimated to cost the state between US\$ 950 million and US\$ 2 billion in lost tourism and other revenue.<sup>19</sup> Estimates to clean the coasts of Peru came to US\$ 2.5 million for cleanup alone, more for necessary equipment.<sup>31</sup>

**FISHERIES/NAVIGATION** When lost nets (some the size of football fields) and traps drift abandoned through the water, they continue to “ghost fish,” depleting already stressed populations of marine life. In Indonesia, a huge net found snagged on a coral reef killed more than 100 sea turtles along with sharks and other marine life.<sup>29</sup> Large numbers of commercially valuable fish killed in this way may impact local fisheries.<sup>19</sup> In the northeast Atlantic, an estimated US\$ 250 million in marketable lobster is lost each year.<sup>31</sup> In the United Kingdom, 92 percent of Shetland fishermen reported recurring problems with debris in nets and that each boat could lose up to US\$ 52,000 per year; the cost to the local industry was estimated as high as US\$ 4.3 million.<sup>13</sup> And debris impedes navigation, from fishing boats and pleasure craft to huge cruise ships and tankers. Collisions with debris can scratch or dent hulls. Items like plastic sheeting, bags, and rope break propellers or jam engines, resulting in expensive repairs, delays, and safety hazards as crews dive to try and cut the debris free. Even submarines have been ensnared in huge fishing nets.

**PUBLIC HEALTH/WATER QUALITY** Medical waste washes ashore on a popular vacation beach. Swimmers exposed to bacteria in the water become ill. Syringes, glass, and metal in the sand cut beach walkers. Studies are exploring how medical waste and other debris may carry and release toxic compounds into the water, affecting water quality and possibly the health of living things. For example, new research suggests that as certain kinds of plastic break down in the ocean, they may produce and give off chemical compounds not normally found in nature, compounds in a form that may be more easily assimilated into the bodies of both humans and marine life.<sup>24</sup> A study at the University of Athens sought to determine if secondary pollution is caused by leaching of pollutants from litter, and found that trace metals can enter the water from debris,<sup>31</sup> which could have implications for human health.

**WILDLIFE** Dolphins and harbor porpoises in the Black Sea, monk seals in the Mediterranean and Hawaii, and sea turtles in the Red Sea and Indonesia: These are just a few of the over 260 species that have been documented as impacted by either entanglement in or ingestion of marine debris. When wildlife becomes entangled, movements, feeding habits, and reproduction can be greatly impaired. Animals that eat trash can choke or die a slow death because the debris clogs their digestive tracts. Or they may starve because they feel full and stop eating altogether. Marine debris also degrades their home, the ocean environment, by smothering fragile ecosystems.

Ocean Conservancy recently completed a survey of published literature on marine mammal interactions with marine debris, confirming that marine mammal species entangle in and ingest many different types of debris, including derelict fishing gear and plastics. These interactions may be hindering the recovery of at-risk species that are also being stressed by other human activities, including global warming. Of the 12 species listed as critically endangered or endangered on the International Union for the Conservation of Nature (IUCN) Red List, recovery of at least five may be hindered by marine debris impacts. While entanglement in derelict fishing gear and plastic materials like packing straps still seems to be a more likely cause of death, ingestion of fishing gear and plastic debris is increasingly cited as a cause of mortality, especially for small cetaceans such as dolphins and beaked whales.

# Most **PLASTICS DEGRADE MORE SLOWLY IN WATER** than on land due to reduced exposure to the sun's UV rays and cooler temperatures.

22

human eye, these minute pieces of plastic go down the drain, through water treatment facilities, and on to the sea.<sup>11,34</sup>

Smaller pieces of plastic are more easily consumed by marine life, but more research is needed to understand the effects on animals and marine ecosystems more broadly. What is known, however, suggests reason for concern. For example, laboratory studies indicate that the surfaces of tiny plastic debris can carry and introduce toxic contaminants into animals, such as through marine worms<sup>28</sup> and blue mussels.<sup>5</sup> Also in laboratory studies, crustaceans and amphibians that had eaten plastic pieces exhibited impaired reproduction.<sup>20</sup> Scientists have noted changes in both behavior and hormone levels in fish exposed to plasticizers (chemicals added to plastics to aid in the manufacturing process).<sup>20</sup> For our part, Ocean Conservancy is doing its best to monitor the latest research findings about plastics in the ocean, and to prevent plastics from becoming marine debris in the first place.

**ABOVE:** ASTOUNDINGLY, ALL OF THIS DEBRIS—INCLUDING CIGARETTE LIGHTERS AND A TOOTHBRUSH—WAS FOUND IN THE CARCASS OF A SINGLE DEAD LAYSAN ALBATROSS FLEDGLING DISCOVERED ON HAWAII'S KURE ATOLL BY RESEARCHER CYNTHIA VANDERSLIP.

# THE PACIFIC GARBAGE PATCH: MYTHS & REALITIES

24

THE PACIFIC GARBAGE PATCH, THE POPULAR NAME GIVEN TO THE TRASH THAT HAS ACCUMULATED IN THE NORTH PACIFIC SUBTROPICAL GYRE, IS ONE OF SEVERAL AREAS OF HIGHLY-CONCENTRATED MARINE DEBRIS LOCATED IN THE PACIFIC OCEAN. OCEAN AND WIND CURRENTS MOVE IN A CIRCULAR PATTERN THERE, CREATING A VORTEX THAT TRAPS AND CONCENTRATES FLOATING ITEMS IN EVER-INCREASING AMOUNTS.

This spiraling whirlpool of trash between California and Hawaii has captured the imagination of the public—and the attention of the scientific community—since it was first publicized in 1997 by Charles Moore of the Algalita Marine Research Foundation, who came across it while on a sailing trip. The eastern Pacific Garbage Patch is created by one of five ocean gyres worldwide; the Algalita Foundation has conducted extensive research on the Pacific Garbage Patch, and most recently took part in an expedition to the North Atlantic Ocean as part of the new 5 Gyres Initiative to determine if other “garbage patches” are forming; the accumulation of marine debris we have seen in the North Pacific may well be occurring in other ocean realms.

Over time, a few misconceptions about the Garbage Patch have been commonly repeated, and scientists are working to convey accurate information to the public.

**MYTH: The Pacific Garbage Patch is twice the size of Texas.**

**FACT:** It is impossible to measure the exact size of a gyre because it is a fluid system that moves constantly. But the fact remains that huge amounts of man-made debris accumulate there.

**MYTH: The Pacific Garbage Patch is like a big island of floating trash.**

**FACT:** No vast island or blanket of garbage is visible in the North Pacific in aerial photographs or satellite images; the accumulation of trash here is like a chunky soup rather than a solid island of garbage you

could walk across. Varying concentrations of debris occur in different places at different times; there are at least three separate spots in the North Pacific where currents cause large accumulations of trash. While rubber rain boots, toothbrushes, and food containers can be seen, much of the debris has been broken down by wind, sun, and wave action into tiny pieces that are harder to see, many of them plastic. Scientists skimming the water with fine mesh nets have discovered that in some parts of the Garbage Patch, while tiny marine life called plankton is still more abundant than plastic fragments in terms of numbers, plastic outweighs plankton six to one.<sup>18</sup>

**MYTH: The solution is easy, we can just clean it up.**

**FACT:** That’s not as simple as it might seem. Finding economically and environmentally viable methods poses a challenge. Locating debris can be tricky because the currents that create the Pacific Garbage Patch shift, moving the litter along with them; time spent searching for it will cost money. Because animals of all sizes, from sea turtles to tiny sea snails, inhabit these trash-laden waters, we can’t just scoop up trash without scooping up essential marine life at the same time.

ABOVE: THE TALL SHIP *KAISEI* AND THE VESSEL *NEW HORIZON* CRISSCROSSED THE GARBAGE PATCH IN 2009 CARRYING RESEARCHERS WHO CONDUCTED AN EXTENSIVE MARINE DEBRIS SURVEY.

## THE GREAT PACIFIC GARBAGE PATCH

**ABOVE:** A THOUSAND MILES FROM SHORE, PROJECT KAISEI CO-FOUNDER MARY CROWLEY AND COLLEAGUES FOUND EVERYTHING FROM ABANDONED FISHING GEAR TO TRASH BROKEN DOWN INTO TINY BITS BY WIND, WAVES, AND SUNLIGHT.

Mary Crowley, a lifelong sailor and advocate, went further than most upon learning of the Garbage Patch: she resolved to do all that she could to clean it up. “The huge problem of marine debris, which is mainly plastic, happened on our watch,” says Crowley, who along with two co-founders established Project Kaisei in 2008. “I feel a responsibility.”

In August 2009, Project Kaisei launched its maiden voyage to the Garbage Patch, teaming up with the University of California’s Scripps Institution of Oceanography to travel throughout the area gathering marine debris samples, which they are now analyzing. The scientific team on board the tall ship Kaisei recorded a steady increase in debris as the ship moved deeper into the North Pacific Gyre. The Scripps team conducted similar research from a second research boat, *New Horizon*.

“We were 1,000 miles from shore, with no sign of human life for days, yet our human ‘footprint’ is now apparent there in one of the most remote places on the planet,” says

Doug Woodring, co-founder and director of Project Kaisei. “It was shocking to see the amount of small pieces of plastic continuously found in all of our 100 nets, in over 1,200 miles of sampling. This should be a message to everyone that our consumption patterns, and ways in which we dispose of products, have failed us. The water in our oceans is like blood for our planet. If we continue to fill it with toxic materials such as plastic, it will be to the detriment of all life on Earth.”

One idea scientists are exploring is whether the debris can be efficiently cleaned up and converted to fuel or some other useful material. Project Kaisei has already tested some methods that can be used with low energy input and low impacts on marine life, and is ready to test them on a larger scale during a second expedition in the summer of 2010.

Research about this critical region is on the rise along with concern about overall ocean health. With support from Ocean Conservancy and The Coca-Cola Company,

researchers at Duke University in North Carolina are compiling all current research on the Pacific Garbage Patch and other similar accumulations of marine debris in order to make a full assessment. They will also evaluate costs and the degree of effectiveness of cleanup options. The growing body of research about the Pacific Garbage Patch will lend itself to a greater understanding of marine debris worldwide.

The reality is that marine debris is now recognized as a major pollution problem around the world—and the Garbage Patch is an ideal living laboratory for investigating the nature of the problem, impacts on water quality and marine life, and science-based solutions. The Garbage Patch has alerted us to the fact that the ocean is not infinite; we can’t just throw trash in it and expect that trash to disappear. Now we know that trash isn’t just accumulating on beaches, but also out in the remotest parts of the ocean. What we learn from the Garbage Patch can help us protect the ocean as a whole—and ourselves—from harmful impacts.

# SPONSORING PARTNERS

26

The International Coastal Cleanup could not take place without the **GENEROUS SUPPORT** of our **DEDICATED** partners.

## THE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION (NOAA) A LEADER IN MARINE DEBRIS PREVENTION

27

Since 2005, cutting-edge work by the NOAA Marine Debris Program (MDP) has moved the cause forward dramatically. The federal program, tasked by the 2006 Marine Debris Research, Prevention and Reduction Act with protecting the US marine environment from the harmful effects of debris, has partnered with the International Coastal Cleanup since its inception.

NOAA program staff are committed to finding science-based solutions to marine debris. NOAA's research about marine debris has helped inform the public about this issue. Educational materials available online at [www.marinedebris.noaa.gov](http://www.marinedebris.noaa.gov) explain the science in everyday language. The NOAA MDP supports innovative projects such as "Fishing for Energy" and "Nets to Energy," which convert old fishing gear—a major marine debris problem—into electricity. NOAA is also leading efforts to plan the 5th International Marine Debris Conference, likely

to be held in early 2011. The conference will provide a much-needed opportunity to share knowledge and work toward global solutions.

The NOAA MDP contributes experience as well as funding for Cleanup outreach and education. NOAA MDP experts share invaluable research and insights with Cleanup staff, and employees get personally involved by participating in Cleanup events in Seattle, Honolulu, and Washington, DC. In 2009, over 170 NOAA employees and family members participated.

"Our goal is to make sure people learn about marine debris, and are engaged and empowered to make a change," says Dr. Holly Bamford, director of the NOAA Marine Debris Program. "The International Coastal Cleanup network allows us to do that across the country and around the world and NOAA is proud to partner with Ocean Conservancy in its Cleanup efforts."

Our goal is to make sure people learn about marine debris, and are engaged and empowered to make a change.

**Dr. Holly Bamford** DIRECTOR OF  
THE NOAA MARINE DEBRIS PROGRAM

**ABOVE:** "GHOST FISHING" OCCURS WHEN LOST FISHING GEAR CATCHES MARINE LIFE, WHICH IS THEN DOOMED TO PERISH.

**ABOVE:** DR. HOLLY BAMFORD PITCHES IN AT THE ANACOSTIA RIVER CLEANUP IN WASHINGTON, DC.

**ALTRIA GROUP, INC****ADDRESSING THE NUMBER ONE ITEM FOUND DURING THE INTERNATIONAL COASTAL CLEANUP**

In 1999, an employee of Philip Morris USA learned that during the International Coastal Cleanup, volunteers around the world pick up more cigarette butts each year than any other item—millions of them. The company took action, calling to ask Ocean Conservancy how they could help, and a partnership was born. Today, Philip Morris USA, which is owned by Altria Group, works to help smokers dispose of smoking-related items properly. “Research shows that often, smokers don’t think of cigarette butts as litter,” says Alisia Rudd, senior manager of corporate responsibility for Altria.

Altria provides funding for materials and other support for the thousands of Cleanup events worldwide, helping modernize our data collection and event registration systems, and supplying travel stipends to help coordinators who might not otherwise be able to attend the annual Coordinators’ Conference. Most recently, an Altria-funded pilot project provided new insights into working with people to change behaviors that cause marine debris. And hundreds of employees of Altria’s companies give of themselves each year at Cleanup events. Altria also supports community prevention programs with Keep America Beautiful (another Cleanup partner).

At the 2009 Cleanup in Washington, DC, Alisia saw the scope of the watershed litter problem firsthand. “I saw a lot of cigarette butts, but I also saw a lot of food packaging, bottles, cans, rubber tires—all kinds of

things,” she says. “And I realized that no single entity can solve the problem alone. It will take a combined effort of corporations, individuals, and organizations to educate people about the impacts of their behavior.”

It will take a combined effort of corporations, individuals, and organizations to educate people about the impacts of their behavior.

# SPONSORS EXPLAIN THEIR COMMITMENT TO THE CLEANUP

## THE COCA-COLA COMPANY

"We are proud to be a longstanding partner with Ocean Conservancy, working towards sustainable solutions to the marine debris issue through the International Coastal Cleanup and other programs."

## BANK OF AMERICA

"Bank of America is proud to partner with Ocean Conservancy to restore the vitality of our ocean and waterways. This year's International Coastal Cleanup provided a tangible way to fight for a thriving ocean and address climate change for our associates, who volunteer in Cleanups around the world."

## ALTRIA GROUP, INC.

"Altria Group, Inc. is committed to reducing the environmental impact of its businesses. We are proud to support Ocean Conservancy's efforts through grants and volunteer activities that help reduce the amount of litter in waterways."

## BOOZ ALLEN HAMILTON

"Booz Allen Hamilton, a strategy and technology consulting firm, is committed to delivering results that endure and is proud to partner with Ocean Conservancy to help protect the ocean for future generations."

## THE DOW CHEMICAL COMPANY

"Dow is proud to have sponsored the Cleanup efforts for the last 24 years. We value our relationship with Ocean Conservancy and their dedication in developing global solutions and public education needed to change the behaviors that cause marine debris and litter."

## NOAA

"The National Oceanic and Atmospheric Administration Marine Debris Program is proud to participate in and partner with Ocean Conservancy on this Cleanup. By working together we can all make a difference in solving the problem of marine debris."

## BRUNSWICK PUBLIC FOUNDATION

"Brunswick Foundation supports Ocean Conservancy in encouraging environmentally responsible behavior on the water. With the boaters we serve, we seek to maintain and protect our invaluable ocean and waterways."

## ORACLE

"Oracle is proud to support the Cleanup. Hundreds of Oracle Volunteers worldwide rally annually to help protect the health of our oceans, beaches, and waterways."

## US ENVIRONMENTAL PROTECTION AGENCY

"For 24 years, the Environmental Protection Agency has been proud to sponsor the Cleanup, allowing volunteers to witness how trash from streets travels to our waterways."

The statements above recognize the leading sponsoring partners of the International Coastal Cleanup. For the complete sponsor list, please see page 55.

# VOLUNTEER COORDINATORS

30

## AND SPONSORS

Coordinators, at the heart of the International Coastal Cleanup, make an **EXTRAORDINARY CONTRIBUTION** of their time and energy all year long. They encourage sponsor support, recruit hundreds of thousands of volunteers, and **ENSURE THAT THE CLEANUP RUNS SMOOTHLY**. They also make sure the all-important data reaches Ocean Conservancy.

# SPOTLIGHT

COUNTRY COORDINATOR, JAPAN

## AZUSA KOJIMA

Co-Founder and Director,  
Japan Environmental Action Network, Japan

As an eight-year-old, Azusa Kojima collected cherry shells during school outings to the beach. “I brought those precious treasures home with great care,” she recalls. “The beaches in Japan were free of trash then—unlike today.”

Azusa is a person who faces challenges head-on. When she noticed litter on the ground where she lives, she picked it up on her daily walks and also designed reusable shopping bags. In 1990 when she heard about the first International Coastal Cleanup (ICC) event in Japan, she contacted the coordinator. As she learned about the impacts of trash on the ocean through materials from Ocean Conservancy, she knew she had to do more. Together, they founded the non-profit Japan Environmental Action Network (JEAN), and the achievements over the past two decades have been phenomenal.

As JEAN celebrates its 20th anniversary with the ICC, this longtime partner has grown the event from 800 volunteers at 80 sites at the first event to about 13,000 participants at more than 200 sites today. Clearly, the ICC has captured attention across this nation cradled by the ocean. JEAN also lobbied for a law giving local governments responsibility for removing and disposing of trash along shorelines—and got it, a history-making accomplishment for a small, non-governmental organization.

“It is very exciting to be able to join the global action of the ICC while working where you live,” says Azusa, who explains that her current challenge is getting people to realize they are responsible for marine litter: “There is a lot in the media about trash reaching Japanese shores from other countries, but people seem unaware of Japanese trash flowing from land out into the ocean. We want to turn that around and promote the perception of marine debris as the responsibility of our entire global society.”

# SPOTLIGHT

## ICC STATE COORDINATOR, MICHIGAN

### JAMIE CROSS

Acting Adopt-a-Beach™ Manager, Alliance  
for the Great Lakes, US

Because trash travels from rivers, lakes, and streams to the ocean, International Coastal Cleanup (ICC) events are held on shorelines everywhere. As Jamie Cross will tell you, the Great Lakes, the world's greatest freshwater resource, are no exception. Jamie has been Michigan ICC coordinator for eight years, since becoming involved through her job with the Alliance for the Great Lakes, a nonprofit that works on lake conservation and restoration through policy and education. The Alliance has a special focus on involving local residents. That's an ideal match for the hands-on ICC, and Jamie has helped the Cleanup grow and make a profound difference over the years.

"The Alliance for the Great Lakes has participated in the ICC in Michigan since 1991," says Jamie. The events range in size from a couple of people working together in a remote area to a crowd of 200. In Michigan, Jamie and the Alliance organized 2,455 volunteers who removed 6,203 pounds of trash in 2009—115,309 debris items in all. Jamie works to promote awareness and increase participation in the ICC by working closely with local media. "The ICC does two things," she explains. "It improves the health of the beaches and shorelines, because volunteers remove debris, and it also helps connect people to the resources in their backyard, in this case the Great Lakes. Then they become better stewards, and take action beyond that day at the beach."

Jamie says the ICC has a visible impact on awareness: "I see more and more people picking up trash on their own through my years of involvement with the Cleanup." And keeping trash out of the Great Lakes makes a truly great difference for the ocean.

# THE MARINE DEBRIS INDEX

38

The Marine Debris Index presents **STATE-BY-STATE AND COUNTRY-BY-COUNTRY DATA ABOUT MARINE DEBRIS** collected and tallied by volunteers around the world on one day each September **AT THE INTERNATIONAL COASTAL CLEANUP.**

# Terminology

SEE TABLE BELOW FOR THE DEFINITION OF TERMS USED THROUGHOUT THE REPORT:

## Inland Cleanup

This type of Cleanup site borders waterways that are located inland, such as rivers, lakes, streams, and ponds. It is not located on the ocean.

## Coastal Cleanup

This type of Cleanup site borders the ocean.

## Land Cleanup

A Cleanup that was conducted on a beach or waterway.

## Underwater Cleanup

A Cleanup that was conducted underwater by certified scuba divers.

## Watercraft Cleanup

A Cleanup that was conducted offshore by watercraft, including kayaks, canoes, sailboats, and motorboats.

## ( - ) in a chart

Data were not collected.

## 0 in a chart

The quantity of the data collected was equal to zero.

## People or Volunteers

The number of people or volunteers at a Cleanup site are counted by the coordinator, totaled for each country, location, or US state, and sent to Ocean Conservancy.

## Pounds

The pounds determined for a country, location, or US state are weighed if the resource to determine weight is available. Where scales are not available, coordinators estimate at 15 pounds a bag.

## Miles

The miles determined for a country, location, or US state are the sum of the estimated distances of each Cleanup site within the country, location, or state. The distance for a Cleanup site is the estimated number of miles from where volunteers started work to the point where they ended. The distance for a Cleanup site is not the sum of all distances covered by all volunteers at a Cleanup site.

# Methodology and Research Notes

40

**O**cean Conservancy, in conjunction with its international and US volunteer coordinators, has collected data during the International Coastal Cleanup since 1986 within the US and internationally since 1989. From 1986 through 2000, Cleanup volunteers tallied debris items on standardized data cards developed and provided by Ocean Conservancy. During this time, debris was categorized by the type of material. In 2001, Ocean Conservancy revised and simplified the data card to include 42 specific debris items and groupings related to five debris-producing activities and sources. The new groupings identify the behavior associated with the debris' presence:

**SHORELINE & RECREATIONAL ACTIVITIES:** indiscriminate and intentional littering by beachgoers, picnickers, participants at waterside sports and festival events washing down creeks and rivers, and litter carried from streets, drains, gutters, and culverts.

**OCEAN/WATERWAY ACTIVITIES:** improper handling of solid wastes from recreational fishing/boating, subsistence/commercial fishing and shipping, military ships, cruise ships, and offshore oil and gas rigs.

**SMOKING-RELATED ACTIVITIES:** improper disposal and littering of smoking-related materials and packaging.

**DUMPING ACTIVITIES:** improper disposal of building and construction materials, drums, tires, cars/car parts, household trash, and appliances.

**MEDICAL/PERSONAL HYGIENE:** materials discarded into sewer systems, dumped into storm drains (along roadways and culverts) and toilets, or left behind by beachgoers.

**S**tarting in 2008, we separated out plastic and paper bags, bringing the number of items tracked to 43. This categorization of the data and volunteer collection is used in 2009. Totals for each site are mailed, emailed, and faxed to Ocean Conservancy, or are entered into Ocean Conservancy's secure Online Data Collection and Reporting Tool by the Cleanup coordinator for the country, territory, or US state. All data sent to Ocean Conservancy and not entered online by the coordinator are entered into the online tool by Ocean Conservancy staff. The result is a unique global, online database of debris information collected from Cleanup sites around the world.

**DATA ANALYSIS:** Data are analyzed by Ocean Conservancy staff. Data are broken down by country, territory, and US state using reports generated by the Online Data Collection and Reporting Tool. Country, territory, and US state geographic designations are made using the CIA World Factbook, [www.cia.gov/library/publications/the-world-factbook/geos/uk.html](http://www.cia.gov/library/publications/the-world-factbook/geos/uk.html). Data are also analyzed by regions which are determined using the UN Statistical Division, <http://unstats.un.org/unsd/methods/m49/m49regin.htm>.

**LIMITATIONS OF THE DATA:** Data are collected by volunteers, not by paid staff or researchers, on a single day in more than 100 countries and territories. Ocean Conservancy currently produces data cards in seven languages; data collection could be more complete with more options, and additional translations are pending. In order to maximize data return, Ocean Conservancy asks for estimates of measurements such as pounds and miles. The totals represented in this report are only what was shared with Ocean Conservancy, and are likely higher due to under-reporting. Weather events can impact planned events and may decrease data return for any country, territory, or US state in any given year.

**INTERPRETATION OF THE DATA:** The data collected provide a snapshot of what was removed from a certain location, on a certain day, by volunteers. The data also provide a local picture of sources and debris items found in US states, countries and territories, and regions of the world, and trends in debris sources, quantities, and types over time. Due to the large sample and long-term, global nature of the collection, the data are effective for educating the public, business, industry, and government officials about the sources and types of marine debris.

Each year, Ocean Conservancy provides a compelling global snapshot of marine debris collected and recorded at sites all over the world on a single day during the International Coastal Cleanup—the world's largest volunteer effort for the world's ocean and waterways. This year's report, *Trash Travels: From Our Hands to the Sea, Around the Globe, and Through Time*, reveals the data recorded by 498,818 volunteers in 108 countries and locations and 45 US states and the District of Columbia during Ocean Conservancy's 24th annual International Coastal Cleanup. They picked up and tallied 7.4 million pounds of marine debris.

Trash traveling to and throughout the ocean is one of the major pollution problems of our time. The comprehensive body of data compiled by Ocean Conservancy each year—the Marine Debris Index—is the only country-by-country, state-by-state, item-by-item accounting of trash in the ocean. The Marine Debris Index has informed efforts to reduce marine debris at the source, change the behaviors that cause it, and create better policies to reduce it.

This year's report explains how trash travels and why that matters. We've created the marine debris problem, and it's time we take responsibility for it. By working together across all boundaries, the global community—individuals, governments, nongovernmental organizations, and corporations—can solve this global pollution problem.
